Out of the Crucible

War surgery and treatment of combat casualties at far-forward locations, frequently under austere conditions, continue to save lives. Military medical personnel provide outstanding health support to those who serve in harm’s way. As war has evolved, so has our medical support to those who fight. Today, American service members face a new terrain of mobile urban conflict. Despite advances in personal and force protection, our forces remain vulnerable to blast wounds, burns, and multiple penetrating injuries not usually or routinely encountered in civilian settings. This publication expertly addresses the appropriate medical management of these and other battle and nonbattle injuries. This updated resource provides state-of-the-art principles and practices of forward trauma surgery practiced by the US military medical personnel.

Emergency War Surgery
Military surgery is a development within the art and science of surgery which is designed to carry out a specialized, essential, and highly significant mission under the adverse conditions of war. The additional necessity of haste in caring for a continuous flow of battle casualties does not mean that military surgery is carried out in an atmosphere of confusion and disorder or that standard principles of treatment are abandoned. On the contrary, as all past military medical history shows, intelligent planning and training, in anticipation of the needs of the emergency, have made possible an enviable record in military medicine.

A longtime standard for military healthcare personnel, the second edition of Military Advanced Regional Anesthesia and Analgesia Handbook (MARAA) has been thoroughly revised and updated. Although the MARAA handbook initially gained its reputation as a useful resource for managing pain associated with battlefield trauma, its beautifully illustrated step-by-step guidance provides pertinent and practical guidance for managing vital acute pain services in all civilian and military clinical settings. Opening chapters review equipment, local anesthesia and additives, and physics of ultrasound and nerve stimulation. Much of the book is devoted to step-by-step guidance on performing various regional anesthesia nerve blocks organized by pertinent neuroanatomy, use of nerve stimulation, and use of ultrasound. The concluding group of chapters discusses organization of the acute pain service and staff, a review of multidisciplinary care, basics of pediatric regional anesthesia, first-
aid acupuncture, and more.
